Series **440**

Molded PTFE Expansion Joints

The Expansion Joint People

PROCO Products, Inc. is the leading manufacturer of rubber, TEFILON®, metal, and fabric connectors and expansion joints in North America, and also offers the industry's widest selection available.

Our manufacturing history of expansion joints dates back to the old Uniroyal company, who invented the rubber expansion joint in 1930. PROCO Products, Inc., previously PROtective COatings of Fort Wayne, Indiana, began marketing rubber expansion joints under its shortened name PROCO in 1980. Protective Coatings manufactured rubber expansion joints for Uniroyal under a private label arrangement from 1965 to 1979. In 1984 PROCO Products acquired all assets of Protective Coatings—including tooling, specifications and technologies used in producing rubber expansion joints—and remains the sole property of PROCO Products today.

PROCO Products operates worldwide through a global agent and distribution network providing a wide range of products and services. This allows us to service the customer during all phases of a project regardless of location. PROCO's main goal is to provide quality products and superior service to the demanding global marketplace.

Quality and service will always be PROCO's highest priority.

TEFLON® is a registered Trademark of E.I. Du Pont de Nemours and company and is used under license by Proco Products, Inc.

PROCO Products, Inc. Corporate Headquarters, Stockton, California.

PROCO

SERIES

440

molded PTFE expansion joints

The PROCO Series 440 PTFE Molded Expansion Joints are used for corrosive applications found in: Chemical-Petrochemical, Industrial Process Piping Systems, Power Generation Plants, Pulp/Paper Plants, Water-Wastewater Sewage and Pollution Control Systems where metallic joints/lap joints or PTFE & FEP-lined rubber expansion joints may have been previously used or specified. Specify PROCO Series 440 expansion joints for installation between anchor points or next to mechanical equipment such as: Absorption Machines, Blowers, Chillers, Fans, Graphite Heat Exchangers, Glass Lined Vessels, Pumps, and Exotic Alloy/Plastic/Glass Lined Piping Systems. The Series 440 expansion joints are designed to: (1) Absorb Pipe Movements/Stress, (2) Reduce System Noise, (3) Reduce Mechanical Vibration, (4) Compensate Alignment/Offset, (5) Eliminate Electrolysis, (6) Protect against Start-up/Surge Forces. Our history in the manufacture of expansion joint products dates back to 1930. When an engineered solution is needed to solve a piping problem, call PROCO.

Engineered For Your Application. The PROCO Series 440 PTFE expansion joints are available in 2, 3, and 5 convolutions. Each convolution profile offers different overall lengths (face-to-face dimensions), movements and pressure/temperature rating to fit the required specification. Available styles include:

- **Style 442-BD:** Features two convolutions for minimal movements, higher pressure/temperature ratings and short face-to-face opening requirements. Style 442-BD sizes range from 1" to 24" diameter. (See Table 1)
- **Style 442-E:** Features two convolutions, and is engineered with T-band compression limiters, limit cables (meets MIL-W-8342), and face-to-face lengths to be an exact equal to other more expensive, competitor models. Style 442-E sizes range from 1" to 12" diameter. (See Table 2)
- **Style 443-BD:** Features three convolutions and is designed for moderate movement and ease of system installation. Style 443-BD sizes range from 1" to 24" diameter. (See Table 3)
- **Style 443-E:** Features three convolutions, and is engineered with T-band compression limiters, limit cables (meets MIL-W-8342), and face-to-face lengths to be an exact equal to other more expensive, competitor models. Style 443-E sizes range from 1" to 8" diameter. (See Table 4)
- **Style 445-BD:** Features five convolutions, and is designed for maximum movements, low pressure/temperature ranges, vibration reduction and greater face-to-face lengths. Style 445-BD sizes range from 1" to 20" diameter. (See Table 5)
- **Style 445-E:** Features five convolutions, and is engineered with T-band compression limiters, limit cables (meets MIL-W-8342), and face-to-face lengths to be an exact equal to other more expensive, competitor models. Style 445-E sizes range from 1" to 6" diameter. (See Table 6)
- **Style 440-BE:** Features Styles' 440-E Neutral Lengths with Styles' 440-BD Limit Bolts. (See Table 7)

Absorbs Pipe-Wall and Fluid-Borne Noise. The quiet operating PROCO Series 440 PTFE expansion joints are a replacement for "sound transmitting" metallic/lap joints. Pipe Wall sound loses energy and is absorbed as the noise carried by the piping enters and exits the PTFE section. Fluid-borne noise is absorbed by the volumetric expansion (breathing of the connector). This action cushions water hammer and smoothes out pumping impulses.

Isolates Vibration and Motion. PROCO Series 440 PTFE expansion joints should be installed immediately after and ahead of equipment generating vibration in order to isolate the rotating/vibrating equipment from the rest of the piping system. For optimum performance, the PROCO Series 440 PTFE expansion joints should be installed horizontally to the shaft. Vertical and perpendicular installations are also acceptable as these expansion joints will accept axial, lateral and angular movements as well as vibration. Note: For maximum vibration transmission reduction, the pipe section beyond the PTFE expansion joints must be anchored or sufficiently rigid.

Reduces System Stress and Strain. Rigid attachment of piping to critical or mechanical equipment can produce excessive loading. Thermal or mechanically created strain-stress-shock are cushioned and absorbed with the installation of a flexible, low spring rate, PROCO Series 440 PTFE expansion joint. The PROCO Series 440 PTFE expansion joint adds a flexible component to the system that automatically self-corrects for misalignment created by structural movements caused by settling, pipe expansion or ground shifts.

Tested Force Pound and Spring Rate Tables. At PROCO we have machine tested nearly every size of the Series 440 PTFE expansion joints for Axial and Lateral Spring Rates and have provided Thrust/Force factors so designers can properly design system restraints. It should be noted that the PROCO Series 440 PTFE expansion joints are in accordance with the performance characteristics of the Fluid Sealing Association's Non-Metallic Expansion Joint Division.

Superior "Flex Life" and Strength. The PROCO Series 440 PTFE expansion joints are contour molded from extruded tubing providing superior "Flex Life" and Strength. Utilizing TEFLON® T-62 resins from DuPont, the PROCO Series 440 PTFE expansion joints provide dramatically more cycle life than that of PFA or FEP.

Flange and Limit Bolts/Cables. All PROCO Series 440 PTFE expansion joint flange configurations are coated with a rust inhibitive primer to prevent corrosion and are dimensionally tapped to ANSI 125/150# Standards. Hole drilling on center line, other drilling standards, or other flange materials, such as 316 stainless, 304 stainless, or Epoxy Coated flanges are available on special order. In addition, all PROCO Series 440 PTFE expansion joints are supplied with factory set limit bolts or cables to prevent over-extension during operation.

Chemical Service Capability at Minimal Cost. Expensive, exotic metal, PTFE or FEP lined rubber expansion joints for severe chemical service can be replaced with the low cost PROCO Series 440 PTFE expansion joints. The PTFE bellows are van stoned to the flanges which allows all wetted surfaces to come in contact with only the PTFE material. Specify the PROCO Series 440 PTFE expansion joints where high temperatures coupled with lower pressures or lower temperatures coupled with higher pressures are proposed. The PROCO Series 440 PTFE offers the lowest cost expansion joint that is impervious to chemical attack. Use the PROCO "Chemical to Elastomer Guide" for reference on chemical compatibility.

Services and Locations. PROCO Series 440 PTFE Expansion Joints have been supplied and successfully used by a range of customers worldwide in the process industries for use in both organic and inorganic chemical processing and production, including such demanding applications as agrochemical and pharmaceutical chemical production, acid processing and food manufacture.

Information • Ordering • Pricing • Delivery. Day or night, weekends and holidays...the PROCO phones are monitored 24 hours around the clock. When you have a question, you can call us.

NOTES: 1. Movements are non-concurrent and based from Neutral Length with Limit Cables installed.

2. Spring Rate Capability is based on 1" of movement at zero pressure conditions.

3. Style 445-E is not designed for Vacuum Service.

Series 445-E Materials of Construction	
Description	1" Through 6"
BELLOWS	PTFE T-62
FLANGES	DUCTILE IRON
REINFORCING RINGS	STAINLESS STEEL
T-BANDS	CARBON STEEL
LIMIT CABLES	MIL-W-8342

Installation Instructions for Series 440 PTFE Expansion Joints

TORQUE TABLE LISTING

SIZE I.D. (IN)	1.0	1.25	1.5	2.0	2.5	3.0	4.0	5.0	6.0	8.0	10.0	12.0
TORQUE (FT/LBS)	10	16	25	52	47	82	54	80	100	135	125	155
TOLERANCE (+/-)(FT/LBS)	2	3	6	13	11	20	13	20	24	32	31	38

Notes: 1. Bolt Torque requirements may vary depending on mating flange material and installation.
2. "Over-Torque" may cause the PTFE material to creep.

1. Service Conditions: Make sure the expansion joint ratings for temperature, vacuum, spring rates and movements match the system requirements. Contact PROCO if the system requirements exceed those of the expansion joint selected.

2. Alignment: PROCO Series 440 PTFE expansion joints are not designed to make up for piping misalignment error. Pipe misalignment should be no more than 1/8" in any direction. Misalignment of an expansion joint will reduce the rated movements and can cause stress of material properties, thus causing reduced service life.

3. Limit Bolt/Cable: Limit bolts and cables are factory set at the maximum allowable travel position to prevent over extension. Do not remove or alter nuts at any time. Damage or personal injury can result due to changes in limit bolt/cable settings.

4. Anchoring: Solid anchoring is required whenever the pipeline changes direction. PROCO Series 440 PTFE expansion joints should be located as close as possible to these anchor points. If an anchoring system is not used, any associated pressure thrust can cause excessive movement, ultimately damaging the expansion joint. (**It should be noted that the attached limit bolts/cables are designed to limit movement and are not designed to handle pressure thrust.**)

5. Pipe Support: Piping must be supported by hangers or anchors so expansion joints do not carry any pipe weight.

6. Personnel Protection: It is strongly recommended that spray shields be used for all hazardous service to protect against serious personal injury in the event of expansion joint failure. (Contact PROCO for spray shield information.)

7. Installation:

a. Store expansion joints with wood covers in-place to protect PTFE flange surfaces from damage until ready to install.

b. Check to make sure PTFE surfaces are clean and free of foreign sediment. Remove nicks, burrs and deep scratches with a fine emery cloth. If surface irregularities cannot be completely removed, install a PTFE envelope-type gasket to obtain an adequate seal.

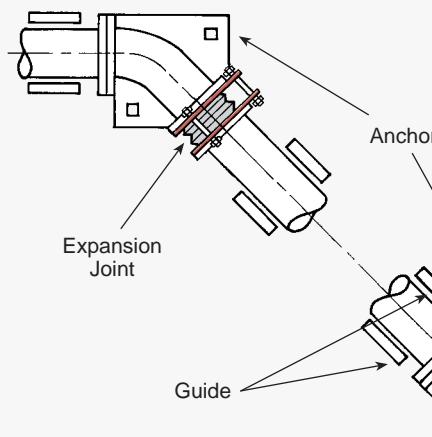

c. Install the PROCO Series 440 PTFE expansion joints to the prescribed neutral lengths. If expansion joints are used in high temperature processes, it is recommended that units be installed at/near the extended values. For cold process installations, expansion joints should be installed in a nearly compressed length. These settings will enable the expansion joint to realize full travel capabilities. (See appropriate Tables for Neutral Lengths.)

d. Thread installation bolts from mating flange side to prevent possible damage to PTFE elements. Extend bolts beyond the expansion joint flange by no more than 1-2 threads. Nuts are not necessary due to threaded flange holes.

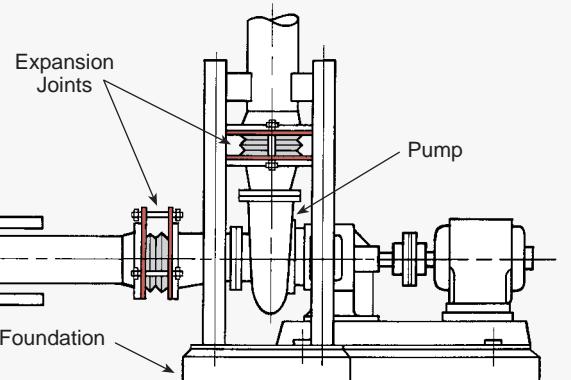

e. Tighten flange bolts with a torque wrench. Tighten in an alternate crossing pattern in 20% increments until 80% of final bolt torques have been achieved. Tighten to final torque values (listed in Torque Table Listing) in a clockwise fashion around the flange to ensure bolts carry equal stress burdens.

f. Re-tighten bolts after first cycle of operation. Re-tighten as necessary after every planned maintenance shutdown. All bolts should be re-torqued to the above listed values.

8. Operations: After expansion joints are installed, it may be necessary to air blast the exterior to remove foreign debris, such as metal chips, from between the convolutions. The expansion joint should then be covered with a shield to protect from damage and foreign debris during operation. (**Note: Do not weld in immediate vicinity of expansion joint unless it is properly protected.**)

TYPICAL PUMP AND PIPING LAYOUT USING EXPANSION JOINTS WHEN EQUIPMENT AND PIPING ARE PROPERLY ANCHORED.

ENGINEERING DESIGN NOTES:

1. It is essential that piping system thrusts be calculated to ensure correct sizing of anchors and pipe supports, plus ensure that allowable thrust forces on adjacent mechanical and rotating equipment are not exceeded. Please use the following formulas:

$$T_p = P \cdot T_f$$

T_p is the pressure thrust (lbf), P is the system operating pressure (psig) and T_f is the thrust factor (or bellows effective area [in^2]). The pressure thrust, T_p , will act in the axial direction and must be added to the axial spring force ($F_x \cdot \Delta x$) to give the total axial reaction force, R_x .

$$R_x = T_p + (F_x \cdot \Delta x)$$

R_x is the pipe support reaction force (lbf), T_p is the pressure thrust (lbf), F_x is the axial spring force of the unit and Δx is the expected or designed axial movement of the unit (See Tables 1-6).

2. It should be noted that axial spring rate values found in Tables 1 through 6 are based on an ambient temperature (70°F) and will decrease as the system temperature rises. In addition, spring rates decrease over time due to thermoplastic creep if units are operated under pressure.

We Cover The World!

PROCO PRODUCTS, INC. **The Expansion Joint People**

Demand the best — insist on PROCO!

- Same-day shipping
- Knowledgeable sales staff that has an average of 20 years experience with expansion joints
- Daily UPS® pick-up
- Preselected freight carriers to minimize "interline transfer"
- Emergency service for nights, weekends, and even holidays
- Complete expansion joint product line
- Largest inventory in North America with warehouses in Stockton, CA
Houston, TX
Atlanta, GA

Same Day Shipment From Order Placement

Warning: Expansion joints may operate in pipelines or equipment carrying fluids and/or gases at elevated temperatures and pressures. Normal precautions should be taken to make sure these parts are installed correctly and inspected regularly. Precautions should be taken to protect personnel in the event of leakage or splash. Note: Piping must be properly aligned and anchored to prevent damage to an expansion joint. Movement must not exceed specified ratings and control units are always recommended to prevent damage in the event other anchoring in the system fails. Properties applications shown throughout this data sheet are typical. This information does not constitute a warranty or representation and we assume no legal responsibility or obligation with respect thereto and the use to which such information may be put. Your specific application should not be undertaken without independent study and evaluation for suitability.

PROCO™

SERIES 4400

convoluted heavy-duty molded PTFE bellows

The PROCO Series 4400 PTFE Molded Bellows Expansion Joints are used for corrosive applications found in: Chemical-Petrochemical, Industrial Process Piping Systems, Power Generating Plants, Pulp/Paper Plants, Water/Wastewater Sewage and Pollution Control Systems where metallic joints/lap joints of PTFE & FEP-lined rubber expansion joints may have been previously used or specified. Specify PROCO Series 4400 Expansion Joints for installation between anchor points or next to mechanical equipment such as: Absorption Machines, Blowers, Chillers, Compressors, Fans, Graphite Heat Exchangers, Glass Lined Vessels, Pumps, and Exotic Alloy/Glass Lined Piping Systems. The Series 4400 Expansion Joints are designed to: (1) Absorb Pipe Movements/Stress, (2) Reduce System Noise, (3) Reduce Mechanical Vibration, (4) Compensate Alignment/Offset, (5) Eliminate Electrolysis, (6) Protect Against Start-up/Surge Forces. Our history in the manufacture of expansion joint products dates back to 1930. When an engineered solution is needed to solve a piping problem, call PROCO.

Engineered For Your Application. The PROCO Series 4400 PTFE Expansion Joints are hot formed from a PTFE tube made with a tape wrapping process. The tube is processed so that the PTFE has a low level of crystallinity, which translates into an improved service life. The seamless PTFE tube is also engineered to have a controlled wall thickness and production methods ensure optimum hoop strength, therefore providing an excellent pressure/vacuum to temperature ratio in the finished product. In most cases this can match that of PTFE lined steel pipe and fittings.

The PROCO Series 4400 is available in 2 convolute through 10 convolute configurations. Each convolution profile offers different overall lengths (face-to-face dimensions) and movements to fit the required specification.

Absorbs Pipe-Wall And Fluid-Borne Noise. The PROCO quiet-operating Series 4400 expansion joints are a replacement for "sound transmitting" metallic/lap joints. Pipe-Wall sound loses energy and is absorbed as the noise carried by the piping enters and exits the PTFE section. Fluid-Borne noise is absorbed by the volumetric expansion (breathing of the connector). This action cushions water hammer and smooths out pumping impulses.

Isolates Vibration And Motion. PROCO Series 4400 PTFE Expansion Joints should be installed right after and ahead of equipment generating vibration in order to isolate the rotating/vibrating equipment from the rest of the piping system. This layout will improve the overall operating performance of the piping system. For optimum performance, the Series 4400 expansion joints should be installed horizontally to the shaft. Vertical and perpendicular installations are also acceptable, as these expansion joints will accept axial, lateral and angular movements as well as vibration. Note: For maximum vibration transmission reduction, the pipe section beyond the PTFE expansion joints must be anchored or sufficiently rigid.

Reduces System Stress and Strain. Rigid attachment of piping to critical or mechanical equipment can produce excessive loading. Thermal or mechanically created strain/stress/shock are cushioned and absorbed with the installation of a flexible PROCO Series 4400 PTFE Expansion Joint. The Series 4400 expansion joint adds a flexible component to the system that automatically self-corrects for misalignment created by structural movements caused by settling, pipe expansion or ground shifts.

Tested Force Pound And Spring Rate Tables. At PROCO we have machine tested several sizes of the Series 4400 expansion joints for Axial Spring Rates and can provide Thrust/Force factors so designers can properly design system restraints. It should be noted that the Series 4400 Molded PTFE Expansion Joints are in accordance with the performance characteristics of the Fluid Sealing Association's Rubber Expansion Joint Division, Technical Handbook Section on Convulated PTFE Bellows.

Flange And Limit Rods. All PROCO Series 4400 expansion joint flange configurations are made of ductile iron, coated with a rust inhibitive primer to prevent corrosion and are dimensionally tapped to ANSI 125/150# Standards. Hole drilling on centerline, other drilling standards, or other flange materials, (such as epoxy coated flanges), are available on special order. In addition, all PTFE expansion joints are supplied with factory set limit rods to prevent over-extension during operation.

Chemical Service Capability at Minimal Cost. Expensive, exotic metal or PTFE or FEP lined rubber expansion joints for severe chemical service can be replaced with the PROCO Series 4400 PTFE Expansion Joints. The PTFE bellows are vanstioned to ductile iron flanges, which allows all wetted surfaces to come in contact with the PTFE material. Specify the Series 4400 expansion joints where high temperatures coupled with lower pressures or lower temperatures coupled with higher pressures are proposed. Molded from PTFE materials, the Series 4400 offers a low-cost expansion joint that is impervious to chemical attack. Use the PROCO "Chemical to Elastomer Guide" for reference on chemical compatibility.

Services And Locations. PROCO Series 4400 PTFE Expansion Joints have been supplied to, and successfully used by a range of customers worldwide in the process industries for use in both organic and inorganic chemical processing and production, including such demanding applications as agrochemical and pharmaceutical chemical production, acid processing and food manufacture.

Larger diameters, custom lengths, and performance requirements available upon request.

Pressure Rating Note:

316 Stainless Steel Anti-Squirm Flanges are available for higher pressure applications. (See Back Cover.)

MATERIALS OF CONSTRUCTION	
DESCRIPTION	STYLE 4410
BELLOWS	WHITE PTFE
FLANGES	DUCTILE IRON
REINFORCING RINGS	304 SS
LIMIT BOLTS	CARBON STEEL
NUTS	CARBON STEEL
INSULATING SLEEVES	POLYETHYLENE
WASHERS	CARBON STEEL / NYLON

Installation Instructions for Convoluted Molded PTFE Bellows

2.5	25	8	50	18	80	—	—

OPTIONAL PRESSURE RATINGS					
Deg F	LIGHT DUTY	EXTRA HEAVY DUTY	Deg F	LIGHT DUTY	EXTRA HEAVY DUTY
70°	145	290	250°	62	107
100°	120	217	300°	48	85
150°	72	175	350°	44	70
200°	62	125	400°	38	65

1. Service Conditions: Make sure the expansion joint ratings for temperature, vacuum, spring rates and movements match the system requirements. Contact PROCO if the system requirements exceed those of the expansion joint selected.

2. Alignment: Expansion joints are not designed to make up for piping misalignment error. Pipe misalignment should be no more than 1/8" in any direction. Misalignment of an expansion joint will reduce the rated movements and can cause stress of material properties, thus causing reduced service life.

3. Limit Rod Bolting: Limit bolts are factory set at the maximum allowable travel position to prevent over extension. Do not remove or alter nuts at any time. Damage or personal injury can result due to changes in limit rod nut settings.

4. Anchoring: Solid anchoring is required whenever the pipeline changes direction. Expansion joints should be located as close as possible to these anchor points. If an anchoring system is not used, any associated pressure thrust can cause excessive movement, ultimately damaging the expansion joint. (**It should be noted that the attached limit rods are designed to limit movement and are not designed to handle pressure thrust.**)

5. Pipe Support: Piping must be supported by hangers or anchors so expansion joints do not carry any pipe weight.

6. Personnel Protection: It is strongly recommended that safety shields be used for all hazardous service to protect against serious personal injury in the event of expansion joint failure. (See Back Cover.)

7. Installation:

a. Store expansion joints with plastic covers in-place to protect PTFE flange surfaces from damage until ready to install.

b. Check to make sure PTFE surfaces are clean and free of foreign sediment. Remove nicks, burrs and deep scratches with a fine emery cloth. If surface irregularities cannot be completely removed, install a PTFE envelope-type gasket to obtain an adequate seal.

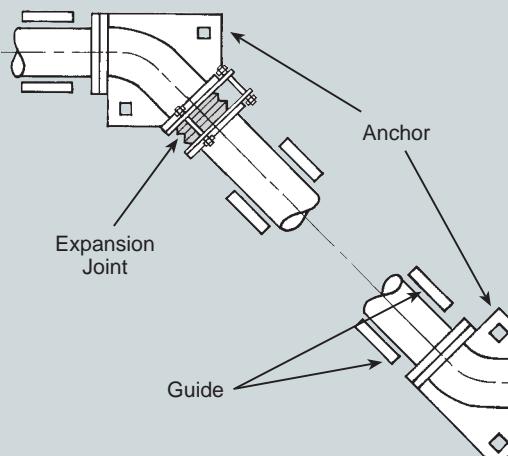

c. Install expansion joints to the prescribed neutral lengths. If expansion joints are used in high temperature processes, it is recommended that units be installed at near extended values. For cold process installations, expansion joints should be installed in a nearly compressed length. These settings will enable the expansion joint to realize full travel capabilities.

d. Thread installation bolts from mating flange side to prevent possible damage to PTFE elements. Extend bolts beyond the expansion joint flange by no more than 1-2 threads. Nuts are not necessary due to threaded flange holes.

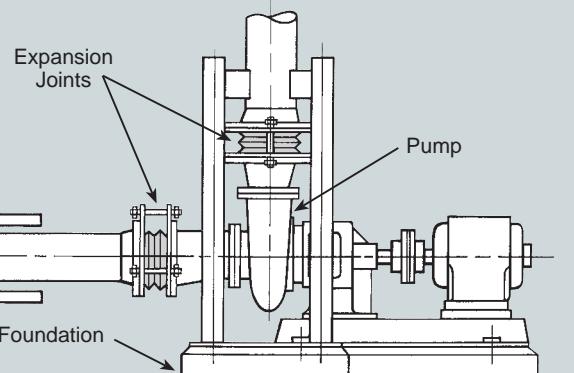

e. Tighten flange bolts with a torque wrench. Tighten in an alternate crossing pattern in 20% increments until 80% of final bolt torques have been achieved. Tighten to final torque values (listed in torque table listing) in a clockwise fashion around the flange to ensure bolts carry equal stress burdens.

f. Re-tighten bolts after first cycle of operation. Re-tighten as necessary after every planned maintenance shutdown. All bolts should be re-torqued to the above listed values.

8. Operations: After expansion joints are installed, it may be necessary to air blast the exterior to remove foreign debris, such as metal chips, from between the convolutions. The expansion joint should then be covered with a shield to protect from damage and foreign debris during operation. (**Note: Do not weld in immediate vicinity of expansion joint unless it is properly protected.**)

TYPICAL PUMP AND PIPING LAYOUT USING EXPANSION JOINTS WHEN EQUIPMENT AND PIPING ARE PROPERLY ANCHORED.

ENGINEERING DESIGN NOTES:

1. It is essential that piping system thrusts be calculated to ensure correct sizing of anchors and pipe supports, plus ensure that allowable thrust forces on adjacent mechanical and rotating equipment are not exceeded. Please use the following formulas:

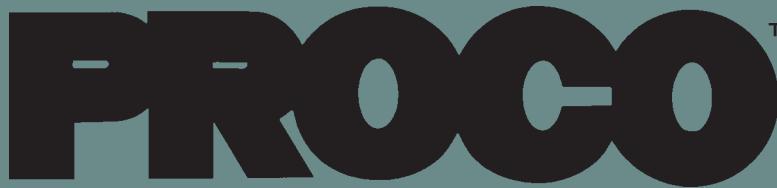

$$T_p = P \cdot T_f$$

T_p is the pressure thrust (lb_f), P is the system operating pressure (Psig) and T_f is the thrust factor (or bellows effective area [in^2]). The pressure thrust, T_p , will act in the axial direction and must be added to the axial spring force ($F_x \cdot \Delta x$) to give the total axial reaction force, R_x .

$$R_x = T_p + (F_x \cdot \Delta x)$$

R_x is the pipe support reaction force (lb_f), T_p is the pressure thrust (lb_f), F_x is the axial spring force of the unit and Δx is the expected or designed axial movement of the unit (See Tables 1-9).

2. It should be noted that axial spring rate values found in Tables 1 through 9 are based on an ambient temperature (70°F) and will decrease as the system temperature rises. In addition, spring rates decrease over time due to thermoplastic creep if units are operated under pressure.

Expansion Joint Accessories

Spray Shields

PROCO Spray Shields are used to help prevent injury to personnel or damage to equipment in the event of a leak or sprayout at expansion joint connections of acids, caustics, chlorine and other dangerous liquids.

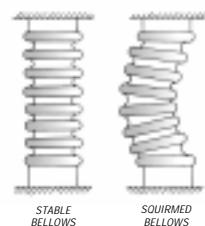

- Same quality design as other cloth shields
- pH indicating patch to signal leaks
- Weep holes behind patch allow indicator to change color
- Attached by Velcro fasteners and drawstrings
- Allows for full movement of the expansion joint
- Available for all PROCO style joints

Anti-Squirm Flanges

When under pressure, a longer bellows will react the same as a column when subjected to compression. At some point both will buckle or "squirm". PROCO can offer a solution to prevent this squirming effect during operation or testing.

Squirm can cause a catastrophic failure of the expansion joint, and serious thought must be given to this condition at time of system engineering. If desired, PROCO can offer a design that will eliminate the squirming effect. Once manufactured, a hydrostatic test of the joint provides assurance that it will hold its form under pressure. If a hydrostatic test is required, it should be specified at the time of quotation.

"When personnel safety and equipment performance are concerns ... contact PROCO."

Demand the best — insist on PROCO.TM

- Same-day shipping
- Knowledgeable sales staff that has average of 12 years experience with expansion joints
- Daily UPS® pick-up
- Preselected freight carriers to minimize "interline transfer"
- Emergency service for nights, weekends, and even holidays
- Complete expansion joint product line
- Largest inventory in North America

Same Day Shipment From Order Placement

Warning: Expansion joints may operate in pipelines or equipment carrying fluids and/or gases at elevated temperatures and pressures. Normal precautions should be taken to make sure these parts are installed correctly and inspected regularly. Precautions should be taken to protect personnel in the event of leakage or splash. Note: Piping must be properly aligned and anchored to prevent damage to an expansion joint. Movement must not exceed specified ratings and control units are always recommended to prevent damage in the event other anchoring in the system fails. Properties applications shown throughout this data sheet are typical. This information does not constitute a warranty or representation and we assume no legal responsibility or obligation with respect thereto and the use to which such information may be put. Your specific application should not be undertaken without independent study and evaluation for suitability.
